

## **AGROffice – Logistics 2010 -Upgrades**

PROGIS AGROffice will be improved and enhanced in 2010! The AGROffice package consists of DokuPlant, WinGIS, and Logistics. The Logistics application is subject to change within 2010. A lot of improvements are planned to introduce. Some of the new features will be

1. Multiuser support at central station
2. Smooth communication and data exchange between AGROffice applications
3. New job management (different fruits, and even different job types, e.g. field management, wood management, etc.)
4. Reliable data transfer among each application
5. Export of data for mobGIS (like in previous versions) is NOT needed anymore. All data will be sent via internet to mobile applications.
6. Automatic program updates via internet
7. Multilanguage support
8. Communication with machines on tractors, harvesting machines, etc. to get information about all activities (speed, hectare meter, work time, job completion, etc.) – *fully implemented at the end of 2011*
9. Remote maintenance of mobile applications – *fully implemented at the end of 2011*

Logistics is divided into a central and a mobile part (named mobGIS). The central stations are used to plan jobs for e.g. vehicles. The mobile application is installed on vehicles to complete jobs. All central stations will see every activity visually after a small sending delay on its GIS component. Optional, every driver may see his/her co-worker within the job on the screen for better arrangement.
